## Converting Between $\mathrm{K}_{\mathrm{c}}$ and $\mathrm{K}_{\mathrm{p}}$

To convert between $\mathrm{K}_{\mathrm{c}}$ to $\mathrm{K}_{\mathrm{p}}$ use the following equation which is based on the relationship between molarities and gas pressures.

$$
K_{p}=K_{c}(R T)^{\Delta n}
$$

$\Delta \mathrm{n}$ is the difference in the number of moles of gases on each side of the balanced equation for the reaction.

$$
\Delta \mathrm{n}=\text { (number of moles of gaseous products }- \text { number of moles of gaseous reactants) }
$$

## Converting $\mathbf{K}_{\mathbf{c}}$ to $\mathbf{K}_{\mathbf{p}}$

Step I: calculate the difference in the number of moles of gases.
Step 2: substitute $\Delta n, R$, and $T$ into the equation and solve.

Example I: Calculate the value of $\mathrm{K}_{\mathrm{p}}$ for the following reaction, at 333 K .

$$
\mathrm{PH}_{3} \mathrm{BCl}_{3(\mathrm{~s})} \rightleftharpoons \mathrm{PH}_{3(\mathrm{~g})}+\mathrm{BCl}_{3(\mathrm{~g})} \mathrm{K}_{\mathrm{c}}=6.96 \times 10^{5} \text { at } 333 \mathrm{~K}
$$

Calculate the difference in the number of moles of gases, $\Delta \mathrm{n}$.

$$
\Delta \mathrm{n}=(2 \text { moles of gaseous products }-0 \text { moles of gaseous reactants })=2
$$

Substitute the values into the equation and calculate $\mathrm{K}_{\mathrm{p}}$.

$$
K_{p}=\left(6.96 \times 10^{-5}\right) \times(0.0821 \times 333)^{2}=0.052
$$

Note: because we do not choose to use units for $K_{c}$ and $K_{p}$, we cannot cancel units for $R$ and $T$. However, be careful to use the value of $R$ consistent with the units of pressure used in the problem, and T in Kelvin.

## Converting $\mathrm{K}_{\mathrm{p}}$ to $\mathbf{K}_{\mathrm{c}}$

Step I: Calculate the change in the number of moles of gases.
Step 2: Substitute $\Delta \mathrm{n}, \mathrm{R}$, and T into the equation and solve.

Example 2: Calculate the value of $\mathrm{K}_{\mathrm{c}}$ at 373 K for the following reaction:

$$
2 \mathrm{NO}_{(\mathrm{g})}+\mathrm{Br}_{2(\mathrm{~g})} \rightleftharpoons 2 \mathrm{NOBr}_{(\mathrm{g})} \quad \mathrm{K}_{\mathrm{p}}=2.4 \text { at } 373 \mathrm{~K}
$$

Calculate the change in the number of moles of gases, $\Delta \mathrm{n}$.

$$
\Delta \mathrm{n}=(2 \text { moles of gaseous products }-3 \text { moles of gaseous reactants })=-1
$$

Substitute the values into the equation and calculate $\mathrm{K}_{\mathrm{c}}$.

$$
\begin{gathered}
2.40=K_{c} \times(0.0821 \times 373)^{-1} \\
K_{c}=73.5
\end{gathered}
$$

Note: because we do not choose to use units for $K_{c}$ and $K_{p}$, we cannot cancel units for $R$ and $T$. However, be careful to use the value of $R$ consistent with the units of pressure used in the problem, and $T$ in Kelvin.
