Mass, Moles \& Number

## Mass, Moles \& Number of Particles

The mole links the mass of a substance to the number of formula units (particles atoms, molecules) it contains. The mass of one mole of an element or compound is referred to as its molar mass, which is its relative atomic mass ( $A_{r}$ ) or relative formula mass $\left(\mathrm{M}_{\mathrm{r}}\right)$ in grams.

$$
\text { Molar Mass }\left(\mathrm{M}_{\mathrm{r}}\right)=\text { Relative Formula Mass (RFM) in grams }
$$

If you have $m$ grams of a substance which has a molar mass of $M_{r}$, then the amount of a substance in moles, $n$, is given by:

$$
\begin{aligned}
& \text { Molar Mass }\left(M_{r}\right)=\text { Mass }(m) / \text { Number of Moles }(n) \\
& \text { Number of Moles }(n)=\text { Mass }(m) / \text { Molar Mass }\left(M_{r}\right) \\
& \text { Number of Particles }=\text { Number of Moles }(n) \times 6.02 \times 10^{23}
\end{aligned}
$$

If you know the values of any two of $n$, $m$ or $M_{r}$, then you can calculate the third using one of the equations above.

## Chemistry Calculating Frame for Moles, Mass and Number of Particles of Atoms \& Molecules

The following simple calculating frame can be used to determine mass, number of moles, the number of particles and volume for elements and chemical compounds.
